

Discover, Decode, Diversify

Medical scientists are discovering how complex the human body really is. It seems to me that this added knowledge would point and push them toward belief in an extremely capable creator. In other words, if it takes exceptional, specially-trained “Einstein” minds – with the help of computer science – just to *unlock* the already existing secrets of the human body, could those same secrets have come into being unconsciously, without the power and plan of a superior intellect? If the answer is yes, then I ask: How? What are the odds of that ever haphazardly happening, even over time? And, who is qualified to configure and confirm those odds?

Now, medical scientists have uncovered what they call *the Golden Path, the Yellow Brick Road, the book of life*. It’s a meticulous “map” of human physical life. The human genome has been decoded. It encompasses recording, *in the correct order*, 3.1 billion nucleotides (sub-units), “letters” or bits of DNA. I am impressed and amazed by this achievement. But scientists did not *create* the genome. They can only discover, decode and diversify what is already there. They can continue to deny the obvious, or they can recognize a supremely intelligent and able architect.

Most recently, secular scientists are excited about the possibility of creating life “from scratch.” But it is *scratch* they did not create. So, then, what’s the big deal? It turns out the *scratch* they are using is already in existence – *basic ingredients* that God created a long time ago.

“If you wish to make an apple pie truly from scratch, you must first invent the universe.”
– Astronomer Carl Sagan (1934-1996) ◇◇◇
